An Introduction to Cardiovascular Physiology is designed primarily for students of medicine and physiology. This introductory text is mostly didactic in teaching style and it attempts to show that knowledge of the circulatory system is derived from experimental observations. This book is organized into 15 chapters. The chapters provide a fuller account of microvascular physiology to reflect the explosion of microvascular research and include a discussion of the fundamental function of the cardiovascular system involving the transfer of nutrients from plasma to the tissue. They also cover major advances in cardiovascular physiology including biochemical events underlying Starling's law of the heart, nonadrenergic, non-cholinergic neurotransmission, the discovery of new vasoactive substances produced by endothelium and the novel concepts on the organization of the central nervous control of the circulation. This book is intended to medicine and physiology students.

Cellular and Molecular Pathobiology of Cardiovascular Disease focuses on the pathophysiology of common cardiovascular disease in the context of its underlying mechanisms and molecular biology. This book has been developed from the editors' experiences teaching an advanced cardiovascular pathology course for PhD trainees in the biomedical sciences, and trainees in cardiology, pathology, public health, and veterinary medicine. No other single-text-reference combines clinical cardiology and cardiovascular pathology with enough molecular content for graduate students in both biomedical research clinical departments. The text is complemented and supported by a variety of photomicrographs, diagrams of molecular relationships, and tables. It is uniquely useful to a wide audience of graduate students and post-doctoral fellows in areas from pathology to physiology, genetics, pharmacology, and more, as well as medical residents in pathology, laboratory medicine, internal medicine, cardiovascular surgery, and cardiology. Explains how to identify cardiovascular pathologies and compare with normal physiology to aid research Gives concise explanations of key issues and background reading suggestions Covers molecular bases of diseases for better understanding of molecular events that precede or accompany the development of pathology

In the compilation of Diagnosis and Treatment of Cardiovascular Diseases, it is mainly divided into: Chapter 1 Structure of the cardiovascular system, Chapter 2 Physiology of the cardiovascular system, Chapter 3 Basis of cardiovascular disease, Chapter 4 Heart failure and cardiogenic shock, Chapter 5 Arrhythmia, Chapter 6 valvulopathy, Chapter 7 Diseases of the cardiac muscle, Chapter 8 Pericardial disease, Chapter 9 Hypertension, Chapter 10 Coronary heart disease, Chapter 11 Aortovascular and peripheral vascular disease, Chapter 12 Pulmonary vascular disease, Chapter 13 Nursing of patients with cardiology diseases.

Blood in Motion is a textbook in Cardiovascular Science. It sets out to introduce, entice and explain the cardiovascular system to the reader using a classical system in teaching anatomy, physiology, general operation and specific systems. It is specifically designed to support the interests of students, experienced physiologists and clinicians. The book is subdivided into three parts, comprising a total of 11 chapters. Part I presents an historical perspective of cardiovascular knowledge and complements it with current insight into the physiology of the cardiovascular system. Part II explores sections of the circulatory loop, starting with an in-depth treatment of the veins, and including the lymphatic, the microcirculation, the arterial system and the heart. Part III incorporates approaches to the cardiovascular system as a whole, both in physiology and in science, such as modeling. This section introduces impedance-defined flow and offers the reader its application in mathematical modeling. At the end of each chapter, the reader will find questions designed to reinforce the information presented. Each chapter can be read or studied as an independent unit.

Cardiovascular disease is a class of diseases that involve the heart or blood vessels, such as arteries, capillaries and veins. Cardiovascular diseases remain the biggest cause of deaths worldwide, though over the last two decades, cardiovascular mortality rates have declined in many high-income countries. At the same time, cardiovascular deaths and disease have increased at a fast rate in low- and middle-income countries. The causes of cardiovascular disease are diverse but atherosclerosis and/or hypertension are the most common ones. There are totally 13 chapters in this book Chapter 1 reviews the signs and symptoms of heat stress illnesses, and discusses a formula for heat stress evaluation, discusses guidelines for screening, reviews accommodations for those persons working or playing with physical incapacity and specific illness in hot environments. Chapter 2 shows the effects of different exercises on the cardiovascular system in elderly people. Aerobic exercise is the most known and recommended for prevention, control and treatment of cardiovascular diseases, especially, the hypertension. Yet, the resistance training with low intensity has also present satisfactory results for the hypotensive effect after exercise. Thus, the aerobic and resistance exercises may have a potential protective non-pharmacological effect and also in the associated treatment for diseases such as hypertension. Chapter 3 describes recent evidence of exercise therapy in the prevention of sarcopenia, glucocorticoid caused myopathy and in case of skeletal muscle unloading. Chapter 4 discusses the spatio-temporal evolution of simultaneously recorded voltage and calcium alternans in the heart. It also discusses whether voltage and calcium alternans can be predicted using slopes of restitution curves. Chapter 5 deals with the evaluation of the effect of storage under various conditions on the concentrations of diagnostically most important bovine acute phase proteins. Chapter 6 reviews the current status of HCM molecular genetics. It addresses the importance of transcriptomics for revealing new diagnostic and therapeutic biomarkers and bioinformatic approaches to improve the translation between the bench and the clinic. Chapter 7 focuses on the role of the immune-system in glaucoma, with special attention on the activation of glial cells from the retina and the increased antigen-presenting activity in macro- and microglia cells both, in the contralateral (normotensive) and hypertensive eyes of unilateral experimental ocular hypertension. Chapter 8 describes the relationships between severity of hypocholesterolemia, abnormalities of plasma amino acids, severity of hypercatabolism and organ dysfunction, and extreme metabolic disruption in trauma patients with sepsis. Chapter 9 summarizes recent advances in cyclic nucleotide signaling and its capacity to control abnormal vascular smooth muscle growth in the context of cardiovascular disease. Chapter 10 describes classifications of endoscopic injuries to the esophagus, the incidence of such burns as well as methods to try to reduce this injury. Chapter 11 proposes the role of autonomic nervous system (ANS), both ANS itself and after the remodeling of it, in atrial fibrillation. In Chapter 12, an application of VCG for detection of cardiac ischemia is explained, a synthesized VCG from standard 12-lead ECG signal is constructed, and a new method to convert a VCG to ECG signals by using partial linear transformation is introduced. Chapter 13 discusses cardiovascular disease in liver cirrhosis. The incidence of cardiovascular diseases in patients with liver cirrhosis is high, and vary according to the underlying cause of liver cirrhosis.
