Finish your journey through the human body with a ride through the bloodstream to visit all the organs in our body. Our resource breaks down each system of the human body to make it easier to understand as a whole. Start off by exploring the arteries, veins and capillaries. Examine your own heartbeat as you learn how to take your pulse. Then, follow the red blood cells as they bring oxygen to the rest of the body. Discover how the food we eat travels down to our stomach and gets digested. Learn how we get energy from that food, and what happens to waste that our body cannot digest. Travel through the excretory system to learn about all the different organs that help us get rid of waste. Build a model of a kidney to see it working in action. Finally, find out how two cells come together to create life. Aligned to the Next Generation State Standards and written to Bloom's Taxonomy and STEAM initiatives, additional hands-on experiments, crossword, word search, comprehension quiz and answer key are also included.

The laboratory guide directs readers through a series of dissection activities for use in the lab accompanied by new, full color photos and figures. The guide can be used as a stand-alone dissection guide or in conjunction with any Anatomy and Physiology Laboratory Manual.

Concepts of Biology is designed for the single-semester introduction to biology course for non-science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand. We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts.

Volume One, The Musculoskeletal System, opens with the building blocks of your body—the cells. Your body is built from many kinds of cells and tissues, and you will learn how they work. Even the bones and muscles that give you strength and speed depend on many types of cells. This book will: Show you the ins and outs of the bones in your skeleton and how they function Give detail as to how your marvelous muscles move you Provide a detailed glossary in the back for quick reference! Throughout the book you

Acces PDF Digestive Anatomy Worksheet Answers

will learn things to do to keep your body healthy. But in a fallen, cursed world things are bound to go wrong. We will look at what happens when disease or injury affects bones and muscles. Volume Two, Cardiovascular and Respiratory Systems. From the level of the cell to the organs themselves, we will examine these systems in depth. Here you will learn: The incredible design of the human heart and how it is really “ two pumps in one! ” How blood moves through an incredible network of arteries and veins What “ blood pressure ” is and the marvelous systems that help regulate it How the respiratory system allows us to get the “ bad air out “ and the “ good air in ” Along the way, we will see what happens when things go wrong. We will also suggest things to do to keep the heart and lungs healthy. Although the world insists that our bodies are merely the result of time and chance, as you examine the human body closely, you will see that it cannot be an accident. It can only be the product of a Master Designer.

The secretions of the exocrine pancreas provide for digestion of a meal into components that are then available for processing and absorption by the intestinal epithelium. Without the exocrine pancreas, malabsorption and malnutrition result. This chapter describes the cellular participants responsible for the secretion of digestive enzymes and fluid that in combination provide a pancreatic secretion that accomplishes the digestive functions of the gland. Key cellular participants, the acinar cell and the duct cell, are responsible for digestive enzyme and fluid secretion, respectively, of the exocrine pancreas. This chapter describes the neurohumoral pathways that mediate the pancreatic response to a meal as well as details of the cellular mechanisms that are necessary for the organ responses, including protein synthesis and transport and ion transports, and the regulation of these responses by intracellular signaling systems. Examples of pancreatic diseases resulting from dysfunction in cellular mechanisms provide emphasis of the importance of the normal physiologic mechanisms.

This project-based resource encourages cooperative, interactive learning experiences that not only help students make connections between various math skills but also make important connections to the real world.

This is the chapter slice "The Reproductive System" from the full lesson plan "Circulatory, Digestive & Reproductive Systems"* How can you tell the difference between an artery and a vein? Our resource tells you how! Learn the major organs of four body systems and how they work to keep us alive and healthy. We begin with blood, blood vessels and the heart. Next, we follow the path food takes from the mouth to the large intestine, and find out how food is turned into fuel. Then it ' s on to how the liver, lungs and skin all help rid our body of toxins. We look inside the kidneys and intestines, and finish with how a tiny sperm and egg cell can grow into a baby. Reading passages, student activities, test prep, and color mini posters all included. All of our content is aligned to your State Standards and are written to Bloom's Taxonomy and STEM initiatives.
