Academic Paper from the year 2021 in the subject Pedagogy - The Teacher, Educational Leadership, grade: 1.00, University of Reading (Institute of Education), language: English, abstract: This paper explores the reasons for the teachers' reluctance to engage in the collaborative tasks, and also the implications this has for collaboration as a tool for professional development. There is increased attention on Continuing Professional Development of teachers for the purpose of improving the quality of teachers' practices and improving pupils' learning experiences and achievement and overall quality of education. One important aspect of teachers' CPD that is championed is 'collaboration'. CPD through collaboration can be considered as an intensive interaction that engages educators in opening up their beliefs and practices to investigation and debate. Collaborative CPD can cover a number of activities ranging from working together with colleagues in informal, unplanned ways to structured, more formalized communities of inquiry or learning communities. Among the potential benefits of Collaborative CPD are sharing knowledge, understanding and experiences and enhancing reflective practices to support professional development. One point is clear that teachers' willingness to actively engage in or to collaborate for the purpose of their professional development is crucial for collaborative CPD. While there are several benefits that come with collaborative CPD, some teachers in the Zambian context are reluctant to collaborate. Why would teachers be reluctant to collaborate?

The text covers random graphs from the basic to the advanced, including numerous exercises and recommendations for further reading.

Despite growing interest, basic information on methods and models for mathematically analyzing algorithms has rarely been directly accessible to practitioners, researchers, or students. An Introduction to the Analysis of Algorithms, Second Edition, organizes and presents that knowledge, fully introducing primary techniques and results in the field. Robert Sedgewick and the late Philippe Flajolet have drawn from both classical mathematics and computer science, integrating discrete mathematics, elementary real analysis, combinatorics, algorithms, and data structures. They emphasize the mathematics needed to support scientific studies that can serve as the basis for predicting algorithm performance and for comparing different algorithms on the basis of performance. Techniques covered in the first half of the book include recurrences, generating functions, asymptotics, and analytic combinatorics. Structures studied in the second half of the book include permutations, trees, strings, tries, and mappings. Numerous examples are included throughout to illustrate applications to the analysis of algorithms that are playing a critical role in the evolution of our modern computational infrastructure. Improvements and additions in this new edition include Upgraded figures and code An all-new chapter introducing analytic combinatorics Simplified derivations via

analytic combinatorics throughout The book's thorough, self-contained coverage will help readers appreciate the field's challenges, prepare them for advanced results—covered in their monograph Analytic Combinatorics and in Donald Knuth's The Art of Computer Programming books—and provide the background they need to keep abreast of new research. "[Sedgewick and Flajolet] are not only worldwide leaders of the field, they also are masters of exposition. I am sure that every serious computer scientist will find this book rewarding in many ways." —From the Foreword by Donald E. Knuth

'Thriller writing of the highest quality. A masterful blend of excitement and tension.' Sunday Telegraph The kidnapping of a young man on a country road in Oxfordshire is but the first brutal step in a ruthless plan to force the President of the United States out of office. If it succeeds, he will be psychologically and emotionally destroyed. Only one man can stop it - Quinn, the world's foremost Negotiator, who must bargain for the life of an innocent man, unaware that ransom was never the kidnapper's real objective . . . The Negotiator unfolds with the spellbinding excitement, unceasing surprise and riveting detail that are the hallmarks of Frederick Forsyth, the master storyteller.

Symmetry is a property which occurs throughout nature and it is therefore natural that symmetry should be considered when attempting to model nature. In many cases, these models are also nonlinear and it is the study of nonlinear symmetric models that has been the basis of much recent work. Although systematic studies of nonlinear problems may be traced back at least to the pioneering contributions of Poincare, this remains an area with challenging problems for mathematicians and scientists. Phenomena whose models exhibit both symmetry and nonlinearity lead to problems which are challenging and rich in complexity, beauty and utility. In recent years, the tools provided by group theory and representation theory have proven to be highly effective in treating nonlinear problems involving symmetry. By these means, highly complex situations may be decomposed into a number of simpler ones which are already understood or are at least easier to handle. In the realm of numerical approximations, the systematic exploitation of symmetry via group representation theory is even more recent. In the hope of stimulating interaction and acquaintance with results and problems in the various fields of applications, bifurcation theory and numerical analysis, we organized the conference and workshop Bifurcation and Symmetry: Cross Influences between Mathematics and Applications during June 2-7,8-14, 1991 at the Philipps University of Marburg, Germany.
