The adaptive filter contains a digital filter with adjustable coefficient (s) and the LMS algorithm to modify the value (s) of coefficient (s) for filtering each sample. The adaptive filter then produces an estimate of noise $y(n)$, which will be subtracted from the corrupted signal $d(n) = s(n) + n(n)$.

Clearly, when $e(k)$ is very small, the adaptive filter response is close to the response of the unknown system. In this case, the same input feeds both the adaptive filter and the unknown. If, for example, the unknown system is a modem, the input often represents white noise, and is a part of the sound you hear from your modem when you log in to your Internet service provider.

An adaptive filter is a system with a linear filter that has a transfer function controlled by variable parameters and a means to adjust those parameters according to an optimization algorithm.Because of the complexity of the optimization algorithms, almost all adaptive filters are digital filters.Adaptive filters are required for some applications because some parameters of the desired ...

The autocorrelation function of the process $x(k)$ is defined by $r_x(k,l)=E[x(k)x(l)] = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} yz p_x(k),x(l)(y,z)dydz$ (2.10) where $p_x(k),x(l)(y,z)$ is the joint probability density of the random variables $x(k)$ and $x(l)$ defined as $p_x(k),x(l)(y,z) = \partial^2 P$

FUNDAMENTALS OF ADAPTIVE FILTERING

The desired signal is $d(n)=v(n)+x(n)$, where $v(n)$ is the echo signal generated from the echo path impulse response. The purpose of an adaptive filter W is to find an echo estimate, $y(n)$ which...

The adaptive filter to remove baseline wander is a special case of notch filtering, with the notch at zero frequency (or dc). Only one weight is needed, and the reference input is a constant with a value of 1 (Table I). This filter has a "zero" at dc and consequently creates a notch with

In the fifth edition of this textbook, author Paulo S.R. Diniz presents updated text on the basic concepts of adaptive signal processing and adaptive filtering. He first introduces the main classes of adaptive filtering algorithms in a unified framework, using clear notations that facilitate actual implementation.

Apply adaptive filters to signal separation using a structure called an adaptive line enhancer (ALE). In adaptive line enhancement, a measured signal $x(n)$ contains two signals, an unknown signal of interest $v(n)$, and a nearly-periodic noise signal $\eta(n)$.

The Wiener filter problem has solutions for three possible cases: one where a noncausal filter is acceptable (requiring an infinite amount of both past and future data), the case where a causal filter is desired (using an infinite amount of past data), and the finite impulse response (FIR) case where only input data is used (i.e. the result or output is not fed back into the filter as in the ...

The adaptive filter structure employed in acoustic echo cancellation is an FIR filter because of its guaranteed stability. This means that, in order to model a given echo path, the adaptive filter is likely to require thousands of coefficients. The large number of adaptive filter coefficients places a strong demand on the computational ...
